ABOUT ME

I'm a second-year Software Engineering student from Travnik, Bosnia. I study at the university in Zenica. I come from a small city, and I've always liked building things that work well and look good.

I'm interested in mobile app design and development, but what I like most is backend logic and well-organized functionality. I enjoy figuring out how systems work behind the scenes just as much as making a clean user interface.

When I'm not coding, I like to be outside. I go cycling, hit the gym, or just enjoy nature around Travnik.

SKILLS

C#, Kotlin, Figma, Firebase, Python, React, JavaScript, Node.js, Linux, Git

PROJECTS

RoadFlow

Tech: Kotlin, Jetpack Compose, Android, MapTiler

I made this app to give drivers real-time info about mobile and stationary speed cameras. The data comes from a verified source that updates automatically every day, so I don't have to update anything by hand. Users can look at a simple list of active locations or switch to tracking mode while driving. I also made a home screen widget where users can pin their two favorite cities and check them quickly.

Frizerski studio Nina

Tech: Kotlin, Android, Jetpack Compose, Firebase, Google Drive API

GitHub: <https://github.com/amel555k/Frizerski-studio-Nina>

This is an Android app I built to replace paper scheduling for a local hair salon. Appointments are saved in Firebase Firestore and update in real time. The app also has a client list, appointment details, and weekly, monthly and yearly statistics.

Sehara Cloud

Tech: Kotlin, Jetpack Compose, C#, PostgreSQL, Linux server, Cloudflare

GitHub: <https://github.com/SamerKolasevic29/SeharaCloud>

An Android app with a C# backend, PostgreSQL database, and a Linux server behind Cloudflare. Still in progress.

Easy Peasy

Tech: .NET MAUI, C#, XAML, Firebase

GitHub: <https://github.com/amel555k/EasyPeasyOrderApp>

Easy Peasy is a mobile food ordering app that is simple to use. Users can browse menus, place orders, and manage their profile. There is also a recent orders section where users can see their order history and order the same meal again in just a few taps.

Tvoja Maja

Tech: React, Node.js

GitHub: <https://github.com/amel555k/Tvoja-Maja>

Tvoja Maja is a web clothing store that is easy to use. Customers can browse t-shirts, hoodies and polo shirts, customize their order in an editor, and send it. Registered users have their own profile where they can see their past orders, and there is a contact form for feedback and suggestions.

There is also an admin panel where admins can see all orders and order statistics. They can change the availability of items and read the messages users send.

LaptopiTravnik

Tech: Inkscape, SketchUp

LaptopiTravnik is a local shop in Travnik that sells refurbished laptops. For a school project, I did the visual identity for the shop. I designed a two-sided brochure that shows the shop's offer in a clean and professional way, made completely in Inkscape.

I also made a 3D model of a ThinkPad laptop in SketchUp, with a custom LaptopiTravnik sticker on it. It can be used in the shop's promotional materials.

MakeltReal

Tech: Kotlin, Jetpack Compose, MapTiler, AR

GitHub: <https://github.com/amel555k/MakeltReal>

Still in progress.
